

Boom Lifts

Boom lifts are machinery that has a platform that can be lowered or lifted to a range of heights, therefore making this piece of equipment an important necessity in a wide range of professions. Available in several specialized kinds such as aerial lifts, scissor lifts, and knuckle boom lifts, each model operates very specifically.

Aerial platform lifts are most commonly used to transport people at ski lodges who are not comfortable using a snowboard lift. These hoists maneuver much like an elevator, snowboarders can be gradually moved up the mountain, stopping at stations along the route until they contact the top. Aerial platform lifts are also used in construction, transporting people securely up and down the sides of multi-level construction sites.

Scissor hoists are quite regularly used by utility companies as the best approach to securely enable staff to repair and work on cables and wires attached to poles. Telephone, cable television and power providers have relied on the effectiveness of this kind of boom jack for years.

Knuckle boom lift trucks are built to be utilized in rough terrain locales where the need to be able to change course is necessary. This style of boom is capable of fitting into various tight places that a scissor jack cannot. Working amid multiple machines in a manufacturing plant or in close proximity stuck between two walls, the knuckle boom also features a standard platform equipped with rails for protection and employee safety.

Depending on the work requirements and the kind of job to be completed will ascertain the proper type of boom lift to pick. Fortunately, there is a version suitable for just about any function.
